

# Lecture 9 - 24/09/24

## • Is my classifier good?

- Introduced common goal  $\rightarrow$  minimize misclassification rate!
- When introducing loss  $\rightarrow$  not all errors are equal!
- $\forall$  classification we have in  $\mathbb{R}^2$  a specific ideal performance f errs to avoid!
- Given that  $\neq$  tasks require  $\neq$  metrics  $\rightarrow$  we have lots of performance metrics

## • No matter which performance metric you choose:

- metric is evaluated on test set

## • At the heart of performance metrics:

		Predicted class			
True class		9	3	28	40
		1	5	34	40
		4	3	33	40
Total		14	11	95	120

$\rightarrow$  Confusion Matrix!

$\rightarrow$  Accuracy:  $(9 + 5 + 33) / 120$

$\rightarrow$  Misclassification Rate:  $(1 + 4 + 3 + 3 + 28 + 34) / 120$

## • Precision & Recall

- How precise are its predictions?

- Precision  $\rightarrow$  # of true positives out of predicted positives

For a stock classified as increasing, what is the prob that it is actually increasing?

- How good is it at detecting cases?

- Recall  $\rightarrow$  # of true positives out of positive cases

Given an increasing stock, what's the prob of detecting it?

Precision

	Predicted class		Total
	0	1	
True class	0	9	40
	1	5	80
Total	14	106	120

$$\text{Precision} = \frac{9}{9+5} \approx 0.64$$

Recall

	Predicted class		Total
	0	1	
True class	0	9	40
	1	5	80
Total	14	106	120

$$\text{Precision} = \frac{9}{40} \approx 0.225$$

- IDEALLY WE WANT OUR MODEL TO HAVE:
  - High Precision
  - High Recall
- Important is to know that:
  - Our choices impact the confusion matrix!
  - The above means that we impact precision & recall

\* We choose decision threshold which impacts confusion matrix!

	$\hat{Y} = 0$	$\hat{Y} = 1$	Total
$Y = 1$	0	111	111
$Y = 0$	0	62	62
Total	0	173	173

	$\hat{Y} = 0$	$\hat{Y} = 1$	Total
$Y = 1$	16	95	111
$Y = 0$	27	35	62
Total	43	130	173

	$\hat{Y} = 0$	$\hat{Y} = 1$	Total
$Y = 1$	111	0	111
$Y = 0$	62	0	62
Total	173	0	173

## F1-Score : HARMONIC MEAN OF PRECISION & RECALL

$$F_1 = \frac{2}{\frac{1}{P} + \frac{1}{R}} = 2 \frac{P \times R}{P + R}$$

The harmonic mean of  $x_1, \dots, x_n$  is  $\left(\frac{1}{n} \sum_{i=1}^n x_i^{-1}\right)^{-1}$

PUNISHES SINGLE LOW NUMBERS MORE THAN THE ARITHMETIC MEAN DOES.

TO GET A HIGH F1-SCORE, HIGH RECALL & PRECISION IS NEEDED!!

FOR  $K$  CLASSES  $\rightarrow$   $K$  SETS OF PRECISION & RECALL &  $K$  F1-SCORES

## ROC CURVE (BINARY CLASSIFICATION)

- THE ROC CURVE PLOTS:

TRUE POSITIVE RATE VS FALSE POSITIVE RATE  
(TP out of POSITIVES) (FP out of NEGATIVES)

ROC Curve

THIS IS THE PARAM CURVE.

ONE POINT = ONE CLASSIFIER

ONE CURVE = SET OF CLASSIFIERS

FOUR LINE FROM BOTTOM LEFT = CHANGE THRESH.

IDEAL CLASSIFIER : TOP LEFT CORNER

IDEAL FAMILIES : HAVE A HUGE AUC
